BOB-202 closure evidence — 2026-09-22

Fix

Root cause confirmed: TAB is an IFS-whitespace character in bash even with IFS explicitly set to a single tab, so while `IFS=$'\t' read -r e_path e_kind e_opt e_pres e_rec` collapses a RUN of consecutive tabs (an empty kind field) into one delimiter, shifting every later field left by one.

Found the project's own existing precedent for the correct fix: `scripts/ownership_precondition.sh` already ships `split_tsv()` (`readarray -d $'\t'`) for exactly this row shape. Per §11.4.251 (one dialect for one question — never reinvent), this was promoted into the shared library as `ownership_split_tsv()` in `scripts/lib/ownership.sh` (both scripts already source it). `ownership_repair.sh`'s scope-entry read loop now calls it instead of `IFS=$'\t' read`. `ownership_precondition.sh`'s own pre-existing `split_tsv()` was left untouched (out of scope, zero risk, already correct).

RED/GREEN evidence (real repair runs with an optional: true, kind-omitted scope entry)

Pre-fix: “declared path does not exist and is not optional” (hard failure, `rc=1`) — the `optional` boolean landed in `kind`'s slot instead. Post-fix: “declared optional — skipped” (`rc=0`, correctly honours the declaration).

Golden-FALSE

A fully-specified row (kind present) parses identically before and after.

Independently re-verified this session

```
$ bash tests/unit/test_ownership_repair_scope_tsv.sh
  PASS: control: the pre-fix reader reproduces the reported field-
shift (treated non-optional, hard-fails) under this identical
harness, proving Case 1 is discriminating
RESULT: 3 passed, 0 failed, 0 skipped
```

Plus the full tests/unit/test_ownership_repair.sh (146/146) — confirms no regression to the 6 shipped config/owned_paths.yaml entries (all carry kind, so this was a latent-defect fix, not a live-behavior change, per the item’s own “NOT reachable from the shipped config today” statement).

See docs/qa/BOB-208/closure_evidence_20260922.md for the combined
git diff --stat.
