BOB-207 closure evidence — 2026-09-22

Finding

BOB-207 (“probe_location() is GID-BLIND”) is already resolved — NOT by widening probe_location() to check gid (the item’s own suggested direction), but by NARROWING ownership_repair.sh’s walk-selection predicate to select on uid only, landed in a prior session (commit 5c9b9e0, corrected by docs commit 1444367 after a mislabelled commit message). scripts/lib/ownership.sh:299-321 carries an in-source block headed “THE AGREED PROPERTY IS uid, NOT uid+gid (BOB-207, §11.4.250)” documenting the resolution and rationale.

Independently re-verified this session by a dedicated subagent, then independently re-run by the coordinator.

Verification

```
$ bash tests/unit/test_ownership_gid_agreement.sh
  PASS: golden-FALSE: precondition and repair agree on a correct
location
RESULT: 5 passed, 0 failed, 0 skipped
```

tests/unit/test_ownership_gid_agreement.sh’s own header states it was authored as the RED that reproduced the defect; the same source now passes and serves as the permanent regression guard. docs/qa/BOB-207/ (pre-existing, from the prior session) holds the full measurement trail.

No new code was written for this item — it was correctly resolved as-is.
