SSE Streaming Issues — RESOLVED

Revision: 1 **Last modified:** 2026-06-06T00:00:00Z

Issue Summary

Real-time streaming of search results via Server-Sent Events (SSE) was not working in the browser. The root cause was identified and fixed.

Root Cause

Missing double newline in SSE event termination.

The `SSEHandler.format_event()` method in `download-proxy/src/api/streaming.py` produced events ending with a single `\n`:

```
event: result_found\ndata: {"name": "..."}\n
```

The Server-Sent Events specification requires events to be terminated by **two newline characters** (`\n\n`). Browsers (including Chrome/Yandex) will not dispatch events that are not properly terminated.

Fix Applied

File: `download-proxy/src/api/streaming.py` **Change:** Added a second empty line to the SSE event format:

```
lines.append("") # Empty line terminates event
lines.append("") # Second newline required by SSE spec
return "\n".join(lines)
```

Verification

Backend (curl)

```
curl -N "http://localhost:7187/api/v1/search/stream/<search_id>"
```

Events now properly end with `\n\n` and are correctly parsed by browsers.

Tests

- tests/unit/test_streaming.py — Added TestSSEFormatCompliance with 3 tests verifying double newline termination
- tests/integration/test_streaming_browser.py — 6 Playwright browser tests (all passing)
- tests/integration/test_realtime_streaming.py — 5 SSE API tests (all passing)

Dashboard Cleanup

Removed temporary debug `console.log` statements and colored status messages that were added during troubleshooting. Kept error logging for network failures.

Network Issues When Remote

Status: FIXED — All `fetch()` calls in the dashboard now use relative URLs (`/api/v1/...`). The only `localhost` reference is in a fallback catch block for config loading.

Auth State UI

Status: COMPLETE - Header shows login/logout buttons - Buttons disabled until authenticated - Login modal functionality works - `doSchedule()` checks `_qbitAuthenticated` - `doDownload()` handles `auth_failed` response from backend

Commit Summary

1. **Fix SSE format:** Added double newline termination per spec
 2. **Add SSE format tests:** 3 compliance tests for event formatting
 3. **Clean dashboard:** Removed debug `console.log` statements and temporary status messages
