

MANIFEST

BOB-086 backfill evidence manifest

Revision: 1 **Last modified:** 2026-08-19T00:00:00Z

Purpose

Captured-evidence artefact for the §11.4.146(D3) status-custody backfill executed under BOB-086. The workable-items DB carried 56 items whose status had reached a Fixed-family terminal state without any corresponding item_history audit row — a silent status change class that violates §11.4.148 (workable-item integrity) and §11.4.146(D3).

BOB-086 backfills one item_history row per silent item, honestly labelled AI-inferred from git-history pickaxe per §11.4.6 (no guessing — the original closure operator / exact timestamp are unrecoverable, so the row records what IS knowable: the git commit that added the item to docs/Fixed.md, and the commit's authored date).

Provenance

- Discovery: `sqlite3 docs/workable_items.db "SELECT DISTINCT atm_id FROM items WHERE current_location='Fixed' AND atm_id NOT IN (SELECT DISTINCT atm_id FROM item_history)"` → 56 rows.
- Closure-commit resolution: `git log --all --oneline -S "<atm_id>" -- docs/Fixed.md | tail -1` per item; fallback to docs/ scope when the pickaxe on Fixed.md was empty (f23879a was the Fixed.md seed commit and predates several items' first mention).
- Date: `git log -1 --format=%cI <commit>` (committer date, ISO).

Backfill schema (per row)

- `event_type` — derived from the item's current terminal status:
 - Fixed (`→ Fixed.md`) `→ Fixed`
 - Completed (`→ Fixed.md`) `→ Completed`
 - Implemented (`→ Fixed.md`) `→ Implemented`
- `by` — AI (schema CHECK constrains to AI/User/NULL; the AI-inferred nature is recorded in `reason`).
- `on_date` — commit date (YYYY-MM-DD), UTC via `%cI`.
- `reason` — historical-backfill-BOB-086 (AI-inferred from git-history pickaxe on `docs/Fixed.md`; original closure committer/timestamp: `git <short-sha>`).
- `evidence_path` — this per-item evidence file (`docs/qa/BOB-086/backfill_evidence/<atm_id>.md`).

Honest boundary (§11.4.6)

- The backfill does NOT invent the original operator, exact closure timestamp, or original evidence artefacts (all unrecoverable). It records the git commit that materialised the closure as the best available anchor.
- The backfill does NOT retro-validate the closures. It restores the audit-trail invariant so future §11.4.146(D3) sweeps do not flag these items as silent.
- BOB-009 + BOB-010 additionally receive `items.commit_ref` + `items.closure_date` (commit 7d243cc, 2026-06-08 — “chore: close BOB-009 and BOB-010 as completed, sync Markdown trackers”) for cross-artefact traceability.

Per-item files

See `backfill_evidence/<atm_id>.md` — one file per backfilled item, each carrying its closure commit + authored date + status → event-type mapping.
