

docs-features-status-rule

DRAFT — Universal constitution rule: docs/ features Status set with video-recording confirmation

Revision: 1 **Last modified:** 2026-06-15T00:00:00Z **Status:**
DRAFT — NOT applied. Constitution edits require the §11.4.26
fetch-first workflow + §11.4.142 independent review, run by the
main agent.

CRITICAL FINDING — the requested rule is ALREADY in the constitution (near-total overlap)

Before drafting a new anchor, I reconciled the operator's PART 1
request against the existing constitution (constitution/
Constitution.md). The request is **already covered, almost
verbatim**, by three anchors that were all added TODAY
(2026-06-15):

- **§11.4.153** — “Comprehensive per-feature Status +
Status_Summary document set with mandatory video-
recording confirmation”. Mandates a docs/features/ Status +
Status_Summary set covering EVERY system component,
EVERY client app/binary/surface (TUI/CLI/Web/desktop/
mobile/API/gRPC/library/ submodule/infra), and EVERY feature
(incl. features ported from incorporated CLI-agents /
submodule catalogue). Per-feature fields: **Component**,
Feature, **Category**, **Implementation**, **Wiring**, **Real-use**,
Tests-coverage, **Validation (PASS/FAIL/SKIP/
PENDING_FORENSICS/OPERATOR-BLOCKED)**, and
Video-recording confirmation (path to captured real-use
video). Clause (4) is the **video-analysis remediation loop**
(analyse → systematic-debug → fix → retest → re-record).

Clause (5) is docs_chain + §11.4.86 fingerprint always-in-sync.
 Clause (6) is **HTML + PDF + DOCX** four-format export.

- **§11.4.154** — Window-scoped capture (NOT whole-screen) + fresh-corpus rotation (remove own prior in-scope recordings when a new run starts).
- **§11.4.155** — Project-name-prefixed recording filenames (<PREFIX>---<scope>---<run-id>.<ext>), prefix resolved via HELIX_RELEASE_PREFIX env (.env) → fallback lowercased snake_case repo-dir name.

Mapping of the operator’s PART 1 request to existing anchors:

Operator’s PART 1 ask	Already covered by
Status + Status_Summary under docs/features for ALL components/client-apps/features	§11.4.153 (1)(7)
Columns: development / wiring / real-use / tests-coverage / validation / verification	§11.4.153 (2) — Implementation/Wiring/Real-use/Tests-coverage/Validation
MANDATORY video-recording-confirmation column	§11.4.153 (2)(3) — “Video-recording confirmation” field
Real use-case playthrough recorded	§11.4.153 (3) + §11.4.154 (window-scoped)
Analyzed by an AI ensemble, problems fixed/retested	§11.4.153 (4) — video-analysis remediation loop
Exported to PDF/DOCX/HTML	§11.4.153 (6) — four-format export (adds DOCX)
Tightly wired via docs_chain so no feature missed	§11.4.153 (5) — docs_chain + §11.4.86 fingerprint

Conclusion (recommendation to the main agent): Do NOT add a duplicate §11.4.156. Per §11.4.17 classification discipline and the constitution’s own no-duplication principle, a new universal anchor restating §11.4.153/.154/.155 would be redundant and a maintenance hazard.

The only genuinely-new element in the operator’s phrasing vs. the existing text is the explicit **“verification” column as distinct from “validation”**, and the explicit naming of the **“AI ensemble”** (the existing §11.4.153 (4) says “analysed” + §11.4.102 loop but does not name an ensemble). These are small deltas. Two options for the main agent (recommend Option A):

- **Option A (RECOMMENDED) — project-side instantiation only, no new universal anchor.** §11.4.153 already says (per §11.4.35) “the consuming project supplies its concrete docs/

features/ layout, feature roster source, recording path, and DOCX exporter”. So Boba should just INSTANTIATE §11.4.153/.154/.155 in its own docs/features/ + CLAUDE.md/ AGENTS.md project layer — including naming the HelixAgent ensemble as its concrete video-analysis mechanism and adding a separate “Verification” column if the operator wants validation/verification split. No constitution change.

- **Option B — tiny refinement to §11.4.153 only (NOT a new §11.4.156).** If the operator insists the universal text must (i) split Validation vs Verification into two columns and (ii) explicitly name an AI-ensemble video-analysis layer, add ONE sentence to §11.4.153 clause (2) and clause (4). This is a §11.4.73 secondary/revision-level refinement, not a primary new anchor. Draft sentence below.
-

DRAFT refinement sentence for §11.4.153 (Option B only — apply via §11.4.26 workflow)

Clause (2) addendum: each feature row’s evidence axis MAY be split into a **Validation** column (the test/gate verdict — PASS/FAIL/SKIP/PENDING FORENSICS/OPERATOR-BLOCKED per §11.4.45) AND a distinct **Verification** column (independent confirmation the feature works for the end user via captured real-use evidence per §11.4.69/§11.4.107 — the video-recording confirmation IS the primary verification artefact); a project that maintains both columns MUST keep them consistent (a Validation PASS with a Verification FAIL is a §11.4.4 test-interrupt, never a confirmed row).

Clause (4) addendum: the per-video analysis MAY be performed by an AI-ensemble video-analysis layer (e.g. an incorporated vasic-digital/HelixDevelopment HelixAgent ensemble per §11.4.74) so the recognition of the video’s presented data is itself multi-model and anti-bluff; the ensemble’s verdict is captured evidence per §11.4.5/§11.4.69 and any defect it surfaces drives the §11.4.102 → fix → §11.4.146 retest → re-record loop to a clean GO per §11.4.134. The ensemble layer COMPLEMENTS, never replaces, the §11.4.107 liveness battery + §11.4.137 content-correctness oracle the row also cites.

Classification (per §11.4.17): **universal** — generic across any project; references no project-specific hardware/vendor. But it is a REFINEMENT of §11.4.153, not a standalone new anchor → it

stays inside §11.4.153, bumping the Constitution Revision (§11.4.73 secondary-version bump), NOT consuming the next free anchor number.

Next free anchor number (if Option B is rejected and the operator truly wants a NEW anchor)

Latest existing anchor in constitution/Constitution.md = **§11.4.155**. The next free number is **§11.4.156**. (Drafting a full §11.4.156 is intentionally NOT done here because it would duplicate §11.4.153 — see the conclusion above. If the operator confirms they want a standalone anchor anyway, the main agent should draft §11.4.156 in the §11.4.153 house style, opening with a verbatim forensic anchor, composing §11.4.45/.56/.86/.106/.107/.128/.143/.153/.154/.155, with a CM-COVENANT-114-156-PROPAGATION gate + recommended functional gate + paired §1.1 mutation, and explicitly stating in its own text how it differs from §11.4.153 to avoid a no-op duplicate.)

DRAFT short mirror paragraph for CLAUDE.md / AGENTS.md / QWEN.md

Use this ONLY if Option B (the §11.4.153 refinement) is applied; the §11.4.153/.154/.155 mirror paragraphs already belong in the consumer files. This is the project-layer instantiation note Boba should add regardless (Option A):

§11.4.153/.154/.155 project instantiation (Boba). Boba maintains its feature ledger under docs/features/Status.md + Status_Summary.md (+ HTML/PDF/DOCX), covering every component (download-proxy, merge service, boba-jackett, qBittorrent-go proxy, webui-bridge, plugins) and every client surface (Angular frontend/ web dashboard, FastAPI Jinja2 dashboard :7187, cmd/boba-ctl CLI, extension/ BobaLink browser extension). Each user-visible feature's confirmation cites a window-scoped (§11.4.154) real-use recording under /Volumes/T7/Downloads/Recordings, filename prefixed boba-... (§11.4.155 — HELIX_RELEASE_PREFIX unset → fallback lowercased repo-dir name boba), analysed by the HelixAgent ensemble (/Volumes/T7/Projects/helix_code/submodules/helix_agent, per §11.4.74) with the §11.4.102→fix→§11.4.146→re-record loop. Always-synced via docs_chain (§11.4.106) + §11.4.86 fingerprint. **Blocker:** neither the HelixAgent ensemble nor docs_chain is currently

a Boba submodule — both must be incorporated per §11.4.74/§11.4.36 before the ensemble-analysis + docs_chain clauses can be honoured.
