

codegraph_validate

scripts/codegraph_validate.sh

Revision: 1 Last modified: 2026-06-06T14:40:00Z

Overview

Anti-bluff verifier for the CodeGraph integration (Constitution §11.4.78 step 4). Proves the local CodeGraph index is real and correctly scoped — not a §11.4 PASS-bluff — using facts obtained only from CodeGraph (CLI + MCP), never from the script reading source files itself.

Prerequisites

- codegraph on PATH (npm-installed per §11.4.78).
- node on PATH.
- A built index: `.codegraph/` present with `codegraph index` already run.

Usage

```
bash scripts/codegraph_validate.sh
```

Exit codes: 0 all checks PASS · 1 one or more checks FAIL · 2 environment problem (codegraph/node absent, or `.codegraph/` missing).

What it checks (7)

1. codegraph present on PATH + version (no hardcoded host path).
2. Index reality — `codegraph status` reports `nodeCount > 0`.
3. **Unforgeable MCP challenge** — drives `codegraph serve --mcp` over stdio and asserts the `codegraph_status` node count returned over MCP equals the CLI node count.

4. Own-code symbol Deduplicator resolves under download-proxy/src/.
5. Own-org submodule INCLUDED (§11.4.79) — versionTagsCmd resolves under constitution/.
6. Third-party EXCLUDED (§11.4.79) — 0 submodules/jackett paths in index.
7. Secrets EXCLUDED (§11.4.10) — 0 .env/config-credential/boba.db paths.

Edge cases

- If codegraph reports a stale version, a standalone shim is shadowing the npm binary on PATH (see docs/CODEGRAPH.md troubleshooting).
- The MCP check uses notifications/initialized + a short delay; the server is async and a torn read returns 0, which fails the check (correct — no bluff).

Internal behaviour

Read-only against the index; starts and tears down a transient MCP server. Never prints secrets.
