

Batch fix verdict “

457cca4..a7e55f9 review: 2 NIT + MINOR-6

Revision: 1 Last modified: 2026-08-18T00:00:00Z

Source: .superpowers/sdd/task-review-457cca4-a7e55f9-report.md.
This batch’s declared scope: challenges/scripts/resource_pressure_signature_challenge.sh (if NITs land there “ they do not), scripts/install-dev-tools.sh (MINOR-6), and this evidence directory. Explicitly out of this batch’s scope: docs/CONTINUATION.md, docs/incidents/, docs/QA_DISCOVERY_LEDGER.md, and any other subagent’s in-flight scope.

NIT-1 “ QA_DISCOVERY_LEDGER.md re-wording “ SKIP (out of scope by task design)

Finding: re-word the ledger’s new-check: line from “§11.4.115 polarity verified” to “§11.4.115 polarity per-signature captured “ see docs/qa/BOB-076/polarity/” citing per-detector artefacts, **in the same fix-forward round that closes IMPORTANT-1.**

Verdict: honest SKIP. Two independent reasons, either alone sufficient:

1. The finding’s own fix instruction ties it explicitly to the IMPORTANT-1 remediation round (the per-signature polarity fixtures IMPORTANT-1 requires do not exist yet in this checkout as of this batch “ creating them is IMPORTANT-1’s job, not this batch’s). Re-wording the ledger line now, before those fixtures land, would either (a) cite artefacts that do not yet exist (a fresh §11.4.6 bluff replacing the old one), or
 1. require this batch to silently absorb IMPORTANT-1’s scope, which was not assigned here.
2. docs/QA_DISCOVERY_LEDGER.md is explicitly listed in this batch’s “Do NOT touch” constraint. Editing it would violate the assigned scope regardless of (1).

Recommendation: the subagent/round that closes IMPORTANT-1 should apply this exact re-wording as its own final step, citing the per-detector artefact paths it just created “ this NIT is trivially closed as a byproduct of that round and should not be tracked as a separate item.

NIT-2 “BOB-068 label-collision reconciliation ticket” SKIP (scope + concurrency risk)

Finding: the incident doc docs/incidents/2026-08-18-auto-committer-BOB-068-investigation.md is honest as written (Â§11.4.6 clean per the reviewer) “no doc edit needed. The action item is to surface the doc’s own Â§8 open item (‘reconcile BOB-068 label collision’ as a tracked workable item via TASK :: reconcile BOB-068 label collision (Â§11.4.140/Â§11.4.202) so the Â§11.4.197 tracker owns follow-through, not the incident doc.

Verdict: honest SKIP, deliberately not actioned in this batch. Filing a workable item through the TASK :: directive mutates the shared SSoT (docs/workable_items.db) and regenerates Issues.md / Issues_Summary.md / Fixed.md / their exports “every one of those files is OUTSIDE this batch’s declared --scope (challenges/scripts/resource_pressure_signature_challenge.sh, scripts/install-dev-tools.sh, docs/qa/task-review-457cca4-a7e55f9-nit-fixes/).

Doing it anyway would be the exact class of risk **IMPORTANT-2 in this same review** flags: a shared-checkout, shared-SSoT mutation landing inside a narrowly-scoped batch commit, un-isolated from whatever concurrent subagent work is touching docs/workable_items.db this session (per docs/incidents/.../BOB-068-investigation.md Â§4.3-4.5’s independently confirmed shared-checkout race). Filing this ticket from inside a batch explicitly forbidden from touching docs/incidents/ and scoped to two unrelated scripts would itself be a scope-boundary violation, not a fix.

Recommendation: the conductor/orchestrator runs TASK :: reconcile BOB-068 label collision “<link to the incident doc Â§8> as its own isolated, correctly-scoped action (its own --scope covering docs/workable_items.db + the regenerated doc set), never bundled into an unrelated batch.

MINOR-6 “install-dev-tools.sh bash>=4.0 gap” FIXED

Finding: declare -A RESULT requires bash >= 4.0; macOS ships bash 3.2 by default; no early version check existed, producing a cryptic declare: -A: invalid option on stock macOS instead of an actionable error.

Verdict: FIXED. Per the suggested portable-pattern fix (not the ‘document Linux-only’ alternative, since the script already supports macOS throughout via its Homebrew install paths “declaring it Linux-only would be a regression, not a fix):

1. Header comment gained a ‘Runtime requirement’ bash >= 4.0 (Â§11.4.35 consumer-DATA declaration) paragraph naming the cause, the macOS failure mode, and the exact remediation.

2. A guard immediately after `set -uo pipefail` checks the real `BASH_VERSINFO[0]` (never OS-family-inferred â€” a Homebrew/ upgraded bash on macOS is a legitimate PASS, per Â§11.4.201 guard-asserts-real-condition) and exits 2 with an actionable message naming the exact fix (`brew install bash + explicit re-invocation path`) before any other script logic runs.

Evidence: docs/qa/task-review-457cca4-a7e55f9-nit-fixes/minor-6-bash-version-guard.md â€” golden-good (real bash 5.2 host, `--check` unaffected, exit 0) + golden-bad (isolated probe proving the exact numeric-comparison + exit-2 + actionable-message logic trips on a bash-3-shaped version array). Honest boundary: no real macOS/bash-3.2 host was available in this session to independently verify the shipped guard end-to-end â€” the header comment states this limitation explicitly; the probe verifies the logic pattern, not the exact shipped invocation.

Verification: `bash -n scripts/install-dev-tools.sh` clean before and after the edit.

Summary

Finding	Verdict	Reason
NIT-1	SKIP	Fix target (docs/ QA_DISCOVERY_LEDGER.md) is out-of-scope for this batch by task design AND is IMPORTANT-1â€™s own remediation-round responsibility
NIT-2	SKIP	Fix action mutates shared SSoT files outside this batchâ€™s declared -- scope; doing it here would repeat the exact concurrent-shared-checkout risk IMPORTANT-2 flags
MINOR-6	FIXED	bash >= 4.0 guard added with header documentation, verified golden-good + golden-bad
