

review_round1_NOGO

BOB-161 CM-NO-FAIL-OPEN-SKIP — §11.4.209 independent review, round 1

Verdict: NO-GO — 0 BLOCKING / 5 IMPORTANT / 7 MINOR
Substrate: Fable (§11.4.209). Reviewer structurally separate from the author (§11.4.70). Date: 2026-08-25. Loop re-arms per §11.4.134 — remediate, re-review to zero findings AND zero warnings.

Why this is a NO-GO and not a nitpick

A **reviewer-authored** mutation survives the entire suite while silently halving real detection. That is the §11.4.115(F) unvalidated-instrumentation condition, and §11.4.194(6)(d) predicts exactly this: the author's own six mutations were all caught; the reviewer's first different one was not.

```
mutation: SESSION_HINTS = ()
suite:    19/19 GREEN (unchanged)
corpus:   6 findings -> 4      (test_merge_api.py:180 and :484
vanish)
and then: gate prints "BELOW baseline — lower BASELINE to 4"
```

The last line is the dangerous part: weakening the instrument presents itself as progress, and the baseline would lock it in.

Findings

IMPORTANT

1. **R3 evasion — tuple-form broad except.** except
(Exception,): / except (ValueError, Exception): over a probe
PASSES though semantically identical to except Exception:.

Live shape at tests/unit/api_layer/test_theme_stream.py:145 (a pass today, one keystroke from an escape).

2. **SESSION_HINTS unvalidated** — see above. A third of the live baseline rests on it.
3. **Fifth blind condition: unreadable files vanish.** except OSError: continue (analyzer 368-370). Demonstrated: 2-file corpus, one chmod-000 containing a real fail-open → “parsed 1” → **PASS**. Same false-null class the four blind checks exist to close, applied to OSError. Broken symlink is the realistic trigger.
4. **R1’s “unambiguous attribute” assumption refuted (§11.4.194(2)).** job.status on a domain object fires R1 on an honest environmental skip; this repo already uses stat.status / metadata.status in probe-capable dirs. Zero live FPs — latent, not active.
5. **“TRACKED SEPARATELY (§11.4.197)” had no tracker row.** Filed by the conductor as **BOB-192**.

MINOR

1. Ratchet absorbs a one-out-one-in swap (count-baseline); pre-build discards stdout on PASS so the changed finding-SET is invisible at the seam. Matches sanctioned precedent; a fingerprint-set baseline would close it.
2. from pytest import skip evades all rules. Zero corpus instances.
3. RESPONSE_DERIVERS is dead code — bare-Name propagation subsumes it.
4. ["status_code"] subscript arm of reads_status covered by no test and no corpus instance.
5. Two latent FP vectors absent from HONEST LIMITS (environmental skip nested under a status-success branch; rebound-name taint with no kill-set).
6. Wiring comment says “18 cases”; the suite reports 19.
7. §11.4.18 companion doc absent. The author’s “four gates have none” is literally true but inverts the evidence — **7 of 12** sibling gates DO have companions, so skipping grows a monotone-decreasing debt class (§11.4.261).

Verified good (proven by execution, not assumed)

19/19 suite confirmed by real run · all 6 baseline findings read and confirmed genuinely fail-open · narrow-except skips beside them correctly untouched · both prior author-fixed false positives hold, with correct R2 attribution · carriers hold including three the author did not write (f-string text, multi-line raw string containing complete fail-open code, # type: comments) · four blind refusals distinct · exact BOB-092 SKIP-on-404 repro caught in a fresh file · exit codes 0/1/2 measured · no self-tightening (sha-verified) ·

wiring top-level, uses the file's pass/fail helpers, honest §11.4.3
SKIP when absent, self-scopes to its checkout · bash -n +
shellcheck -S warning clean.

Nothing found invalidates the detector's core definition, the
ratchet mechanism, or the wiring.

Not analysed (stated, never assumed safe)

python3-absent exit-2 branch (host has python3; read-only
verification) · behaviour on Python versions other than the host's
3.14.6 · skips outside pytest.skip in shell/Go harnesses (outside
the gate's declared scope) · the 175 dirty exports in the worktree
(excluded by instruction, and not authored by this change).
