

Jackett update research (2026-06-06)

Finding: there is NO Jackett git submodule. Jackett is consumed three ways, all already current:

1. **Jackett server** – the `lscr.io/linuxserver/jackett:latest` container image (which packages `github.com/Jackett/Jackett`). Pulled to latest this session (server build 2026-06-06). New indexer definitions/fixes ship via the image; nothing is vendored or built from Jackett source.
2. **qBittorrent jackett.py search plugin** (`plugins/community/jackett.py`) – canonical upstream is `qbittorrent/search-plugins` (NOT `Jackett/Jackett`). Our copy is at **parity (v4.9)** plus two local improvements that MUST be preserved on any re-sync: (a) `JACKETT_API_KEY/JACKETT_URL` env overrides in `load_configuration()`, (b) the `if not indexers: return zero-indexers guard` (BOB-016). Verbatim upstream saved at `upstream_jackett.py.txt` for diffing.
3. **boba-jackett** Go service – our own credential/indexer manager.

Conclusion: no source replacement needed; the image is the update vector. Adding Jackett/Jackett as a submodule (building the .NET server from source) would be a major architectural change vs. the maintained image – operator decision, not done unilaterally (§11.4.66/§11.4.122).

Update (operator decision 2026-06-06): Jackett added as REFERENCE submodule

Per operator choice, `git@github.com:Jackett/Jackett.git` is now a **reference-only** git submodule at `submodules/jackett` (latest release **v0.24.2027**, shallow). It is for source awareness / inspection / cherry-picking indexer definitions – the RUNTIME still uses the maintained `lscr.io/linuxserver/jackett:latest` image; we do NOT build Jackett from source. (BOB-019)
