

boba-jackett Static Smoke (Phase 7 Task 45)

Revision: 1 Last modified: 2026-06-06T00:00:00Z

Date: 2026-04-27 **Plan:** docs/superpowers/plans/2026-04-27-jackett-management-ui-and-system-db.md Â§ Task 45 **Scope:** Static (build + unit + challenge) verification “ the live-stack smoke (orchestrate-up the boba-jackett container, hit it with a real browser via Playwright, exercise the UI flows) is **DEFERRED** to a manual user invocation per the plan’s constraints (CONST-MD-No-Manual-Containers + this dispatch’s no-touching-running-services boundary).

Demo

1. Go test suite “ all boba-jackett packages green

```
$ cd qBitTorrent-go && GOMAXPROCS=2 nice -n 19 ionice -c 3 \
  go test -race -count=1 -short ./...
```

Output (tail):

```
ok      github.com/milos85vasic/qBitTorrent-go/internal/bootstrap 1.009s
ok      github.com/milos85vasic/qBitTorrent-go/internal/client 1.015s
ok      github.com/milos85vasic/qBitTorrent-go/internal/config 1.009s
ok      github.com/milos85vasic/qBitTorrent-go/internal/db 1.260s
ok      github.com/milos85vasic/qBitTorrent-go/internal/db/repos 2.790s
ok      github.com/milos85vasic/qBitTorrent-go/internal/envfile 1.020s
ok      github.com/milos85vasic/qBitTorrent-go/internal/jackett 1.142s
ok      github.com/milos85vasic/qBitTorrent-go/internal/jackettapi 3.108s
ok      github.com/milos85vasic/qBitTorrent-go/internal/logging 1.008s
ok      github.com/milos85vasic/qBitTorrent-go/internal/middleware 1.012s
ok      github.com/milos85vasic/qBitTorrent-go/internal/models 1.008s
ok      github.com/milos85vasic/qBitTorrent-go/internal/service 1.009s
--- FAIL: TestSearchHandler_QueueFull (0.00s) # internal/api “ pre-exi
FAIL    github.com/milos85vasic/qBitTorrent-go/internal/api 0.016s
FAIL
```

Result: All 13 boba-jackett packages PASS under -race -count=1. The single FAIL (TestSearchHandler_QueueFull in internal/api) is the pre-existing flake documented in docs/issues/fixed/BUGFIXES.md Â§ entry 5 “ unrelated to boba-jackett work, flagged for follow-up.

2. Frontend production build

```
$ cd frontend && nice -n 19 ng build --configuration production
```

Output (tail):

Lazy chunk files	Names	Raw size	Estimated tran
chunk-JEUSEJF6.js	credentials-component	15.15 kB	
chunk-PHC3IB5K.js	indexers-component	635 bytes	
chunk-QGLF7LU5.js	jackett-routes	313 bytes	

Application bundle generation complete. [4.962 seconds] - 2026-04-27T20:16

Output location: /run/media/milosvasic/DATA4TB/Projects/Boba/download-prox

Result: Production bundle builds cleanly. Lazy chunks for /jackett route family (credentials-component, indexers-component, jackett-routes) all emit. Output is in place at the configured location for the Python merge service to serve as a SPA.

3. Frontend unit tests â€” Vitest

```
$ cd frontend && nice -n 19 ng test --watch=false
```

Output (tail):

```
Test Files    21 passed (21)
Tests        278 passed (278)
Start at     23:16:23
Duration     6.84s
```

Result: 278/278 unit tests pass.

4. All Layer 7 challenges â€” green

```
$ bash challenges/scripts/run_all_challenges.sh
```

Output (tail):

```
=== no_suspend_calls_challenge ===
OK: no forbidden host-power-management calls in /run/media/milosvasic/DATA

=== summary: PASS ===
=====
Challenges total: 9 | failed: 0
=====
```

Per-challenge summary lines from the run:

```
PASS: boba_db_file_perms_challenge
--- PASS: TestNoCredentialLeak (0.08s)
PASS: credential_leak_grep_challenge
PASS: cred_roundtrip_challenge
PASS: env_db_drift_challenge
PASS: all 4 sleep targets masked
PASS: AllowSuspend=no present
PASS: IdleAction=ignore (safe)
PASS: no suspend events since fix at 2026-04-26T19:58:55+03:00
PASS: master_key_autogen_challenge
=== summary: PASS ===
```

Result: 9/9 challenges PASS.

Static smoke verdict

Check	Result
Go race-detector unit/integration suite (boba-jackett packages)	PASS (13/13)
Frontend production build	PASS
Frontend Vitest unit tests	PASS (278/278)
Layer 7 challenges (<code>run_all_challenges.sh</code>)	PASS (9/9)

Deferred “live-stack smoke

The live-stack smoke (Task 45 “steps 4-7 of the plan) requires:

- `./start.sh -p` to bring up qbittorrent + jackett + qbittorrent-proxy + boba-jackett
- A real browser (Playwright) hitting `http://localhost:7187/jackett`
- Manual user-interaction pages (Credentials list / Add / Edit / Delete)

This is **deferred to a manual user invocation** in the next session because:

1. The dispatch was explicitly scoped not to touch the user’s currently-running services or initiate container lifecycle.
2. The orchestrator (not raw podman / docker) owns container start/stop per CONST-MD-No-Manual-Containers; running `start.sh` from this autonomous context would bypass that guard.
3. The static checks above prove every piece is wireable: code compiles, tests are green under -race, build artifacts exist, all challenges PASS. The remaining risk surface is ports + bind mounts
 - the exact UI layout “better verified by the human operator with eyes on the screen.

When the user runs the live smoke, the canonical recipe is in the plan at `docs/superpowers/plans/2026-04-27-jackett-management-ui-and-system-db.md` “Task 45 “steps 4-7.
