				Host venv and production container run different starlette versions (1.4.1 vs 1.6.0)
BOB-155	Bug	Fixed (→ Fixed.md)	High	workable-items diff reports 'DB and Markdown are in sync' having opened zero Markdown files when -issues/-fixes are omitted
BOB-156	Bug	Queued	Medium	BOB-145 event-loop regression guard is load-sensitive and flaky: 8786ms under host load vs a 900-1500ms ceiling calibrated on a quiet host Reported-Via: §11.4.202 reporting directive bug on 2026-08-21T17:18:18Z Reported-By: AI What (the report, verbatim): Our own diagnostic is a crash vector, and it is still armed. download-proxy/src/main.py:135 calls faulthandler.dump_traceback(file=sink, all_threads=True) on a live 18-thread process; three further registrations at 214/217/219 use all_threads=True as well. Upstream python/cpython#11600 and #128400 are the same NULL f_executable in dump_frame() at Python traceback.c:1190 - FIXED and backported to 3.13/3.14, with NO 3.12 backport listed. The container ships Python 3.12.13. Container logs still show 'BOB-137 stall watchdog armed: stall>20.0s'. It has not fired again only because BOB-137's root cause was improved enough that the loop rarely stalls past the threshold - but BOB-137 NOT closed, and its live verification the same day measured the loop still blocking, with 18.4% of probes stalled 1-5s and two dead events in 15 minutes. So this is latent, not resolved: one 20s stall away. Note the perverse shape - the worse the wedge gets, the more likely the tool built to diagnose it is to kill the process, destroying the evidence it exists to capture. Found while investigating BOB-131, whose own premise (a common crash) turned out to be false: no common process crashed; the ticket conflated the python3 segfault with an unrelated 14-hour absence caused by a host power-off Affected scope / file-scope manifest:
BOB-157	Bug	Queued	High	

ATM ID	Type	Status	Severity	Description
				download-proxy/src/main.py:135 (and the registrations at 214/217/219) Reproduction / context: 2026-08-20 17:56:26 CEST, one occurrence: kernel 'python3[314359]: segfault at 70 ... in libpython3.12.so.1.0' plus the container's own truncated dump ending mid-' File ' The kernel Code: bytes at IP were byte-matched against the library inside the running container (MATCH), decoding 'mov r14,[r12] (frame->f_executable = NULL) then mov rax,[r14+0x70] (code->co_filename) -> fault; the preceding le resolves to the literal' File ' with edx=7 its exact length. The watchdog had fired 17 times in 16 minutes that day; dump completed to the file sink, then the stdlib pass crashed. Acceptance criteria: The diagnostic cannot crash the service it diagnoses. Either all_threads=True is dropped for the periodic dump, or the dump is gated behind something that cannot fault on a live multi-threaded process, or the runtime moves to a Python where the upstream fix is present - and whichever is chosen, the choice is recorded against the upstream issue so that later runtime bump does not silently re-arm it.
