BOB-161 closure evidence — CM-NO-FAIL-OPEN-SKIP gate

Revision: 1 Last modified: 2026-09-23T16:19:41Z

Claim

The §11.4.69 gate CM-NO-FAIL-OPEN-SKIP now exists (scripts/pre_build/check_cm_no_fail_open_skip.sh + cm_no_fail_open_skip_analyzer.py), is wired as pre-build invariant 57, and ratchets the fail-open skips that exist today against scripts/pre_build/cm_no_fail_open_skip.baseline as a SET (NEW and STALE both fail).

Evidence (this session)

- RED (harness written before the gate): FAIL: gate or engine missing ... CM-NO-FAIL-OPEN-SKIP does not exist rc=1 (subagent capture).
- GREEN, independently re-run from the conductor shell: bash tests/pre_build/test_check_cm_no_fail_open_skip.sh -> === all cases PASS === rc=0; last case PASS: case 10/M3: neutered baseline comparison flips case 1.
- Real tree, conductor shell: PASS: CM-NO-FAIL-OPEN-SKIP: 10 finding(s) (10 baselined, 0 new, 0 stale) across 412 test files, 69 skip sites; control-needle: seen
- Paired §1.1 mutations M1 (detection off -> control needle refuses rc=2), M2 (detection+needle off -> gate passes known-bad tree; caught by harness case 1), M3 (baseline comparison off -> case 1 flips).

- Golden-FALSE-with-carrier: comments/strings/docstrings and environment-derived skips produce no findings (harness case).

Honest gaps

- Baseline records 10 findings, not the 6 BOB-192 described; BOB-192 acceptance is now “these 10 rows to 0” (tracked there, remains open).
- Tracing is per-file; fixture-parameter flows and `getfixturevalue` wrappers are not followed; shell coverage is the `ab_skip` family only.
- Ordinal in the key means swapping two same-type skips inside one function is not detected.
