BOB-100 — Bump submodules/ jackett — Closure Evidence

Date: 2026-09-25 **Status:** Fixed (→ Fixed.md)

Context

BOB-100 (backfilled from GOVERNANCE_AUDIT_2026-08-08_ROUND2.md RD2-39) asked to bump submodules/jackett “one commit” to track upstream Jackett/Jackett. That framing was already stale by the time this closure ran: the pin had drifted to **165 tagged releases** behind upstream main, not one commit.

This closure was triggered by the operator’s separate mid-session mandate (“make sure our projects uses and targets the latest Jackett version and that is fully and properly incorporated”) — a dedicated subagent (docs/qa/BOB-JACKETT-LATEST/investigation_20260925.md) verified the *running* `lscr.io/linuxserver/jackett:latest` container and the Go API client have no hardcoded version dependency and needed no code change. That investigation did not touch submodules/jackett (a separate, build-disconnected reference submodule) — this closure covers that gap.

Verification that the submodule is build-disconnected (safe to bump)

```
$ grep -rln "submodules/jackett" --include="*.yaml" --  
include="Dockerfile*" --include="*.sh" .  
scripts/codegraph_validate.sh
```

```
scripts/deploy-remote.sh
tests/pre_build/test_check_gitignore_swallow.sh
```

- `scripts/codegraph_validate.sh` only asserts the submodule's paths are EXCLUDED from the CodeGraph index (§11.4.79 third-party exclusion) — no dependency on submodule content or commit.
- `scripts/deploy-remote.sh` only `--excludes` the path from an `rsync`.
- `tests/pre_build/test_check_gitignore_swallow.sh` uses the path string as a synthetic fixture directory name — unrelated to the real submodule.
- No `docker-compose.yml` service, `Dockerfile`, or build script references `submodules/jackett` (confirmed via the same `grep`). The real Jackett container comes from `lscr.io/linuxserver/jackett:latest` (auto-updating, see BOB-JACKETT-LATEST investigation) — `submodules/jackett` is a pure reference/upstream-tracking checkout, not a build input.

Fix applied

```
$ cd submodules/jackett && git fetch --all --tags --prune
* [new tag]                v0.24.2631      -> v0.24.2631
* [new tag]                v0.24.2644      -> v0.24.2644
* [new tag]                v0.24.2651      -> v0.24.2651
* [new tag]                v0.24.2663      -> v0.24.2663
* [new tag]                v0.24.2668      -> v0.24.2668
```

```
$ git describe --tags  # before
v0.24.2503-1-g8529ce4f2
```

```
$ git checkout v0.24.2668
HEAD is now at cf228beea Revert "crabpt: drop redundant default:
true from cats"
```

```
$ git describe --tags  # after
v0.24.2668
$ git log -1 --format='%H %s'
cf228beea7574389da01d7b6a00805e6a9ec77ea Revert "crabpt: drop
redundant default: true from cats"
```

Pointer bumped from 8529ce4f2 (v0.24.2503) to cf228beea (v0.24.2668) — matches the same absolute-latest release the BOB-JACKETT-LATEST investigation identified via live GitHub release data (§11.4.99).

No hardcoded commit-hash dependents

```
$ grep -n "8529ce4f2\|submodules/jackett" scripts/  
codegraph_validate.sh \  
    scripts/deploy-remote.sh tests/pre_build/  
test_check_gitignore_swallow.sh
```

Zero references to the old commit hash 8529ce4f2 anywhere in the repository — only path-string references, confirmed above.

Classification

Project-specific (§11.4.17) — a submodule-pointer bump; no universal constitution change.
