BOB-061 / BOB-062 — Suite stabilization + hang elimination

Revision: 1 **Last modified:** 2026-06-10T00:00:00Z **Status:** Fixed ·
Commits: 6e15a8d, 6230865 **Mandate:** §11.4.50 (determinism), §11.4.98
(autonomous tests), §11.4.69/§11.4.102/§11.4.114.

BOB-061 — Unit-suite hang + order- dependent test-pollution

Root causes (proven via §11.4.102 systematic debugging + §11.4.114 clean-HEAD isolation): 1. **enricher full-suite hang** — `_lookup_tvmaze/_openlibrary/_musicbrainz` did real aiohttp GETs with no timeout; musicbrainz throttling stalled the event loop (the 87% monolithic stall). Fixed: `ClientTimeout(total=10)` on all 6 sessions + `test_resolve_no_apis` stubs the lookups (offline/autonomous). 2. **test-pollution** (13–34 order-dependent failures; `pytest-randomly` active): - `tests/conftest.py _CORRECT_MS_PATH` used `.parent (=tests/)` not `.parent.parent (=repo root)` → a non-existent `tests/download-proxy/...` path corrupted `merge_service.__path__` → 11 victims (all 6 `scheduler_api`, `TestLifespan`, `routes_coverage`). - raw `sys.modules` stubs (`helpers/env_loader/novaprinter/socks/tokyotoshokan/kinozal/rutor/iptorrents`) leaked across files → extended `_POLLUTING_ROOTS`. - `socket.socket` (kinozal SOCKS) + `os.environ` (credential tests) leaked → `snapshot/restore` per unit test in the `autouse` fixture.

BOB-062 — Unbounded loops + unbounded network I/O

- kickass/bitsearch/torrentgalaxy while True: search loops could run forever (index-ignoring upstream) → MAX_PAGES=50 caps + RED loop-cap regression tests.
- search.py fetch_torrent, routes.py ×3 qbit sessions, helpers.py retrieve_url/download_file, eztv.py fallback → all given explicit timeouts (aiohttp.ClientTimeout 10/30 / urlopen timeout=30). Each with a RED-on-removal regression guard (mutation-verified by code review).
- test_dashboard qbit-auth test mocked (was a real localhost:7185 connect).

Rock-solid proof (captured)

monolithic – previously stalled, now completes:

```
pytest tests/unit/ -q --import-mode=importlib --timeout=60
```

→ 4121 passed, 0 failed in 324.56s

determinism (§11.4.50) – top-level scope, multiple random seeds:

seed 7 → 3150 passed, 0 failed

seed 42 → 3150 passed, 0 failed

seed 100 → 3150 passed, 0 failed

seed 31337 → 3150 passed, 0 failed

seed 12345 → 3150 passed, 0 failed

merge_service → 801 passed api_layer → 170 passed

Clean-HEAD isolation (§11.4.114): HEAD 44f15b2 top-level = 34 failed/3070 passed; this work = 0 failed → fixes are net-positive, introduce nothing. Two code-review passes returned GO (zero findings, zero warnings) after remediation (§11.4.134).
