BOB-063 — pirateiro test-isolation defense-in-depth — QA evidence

Revision: 1 **Last modified:** 2026-06-10T05:12:40Z **Ticket:** BOB-063
(Task — add pirateiro isolation to conftest; close it as Completed)
Scope: QA evidence (§11.4.83 docs/qa, §11.4.115 RED-on-broken polarity proof, §11.4.135 standing regression guard)

Defect (discovered §11.4.118)

tests/unit/test_plugin_pirateiro.py:32 registers
sys.modules["pirateiro"] = <plugins/community/pirateiro.py> at
module-collection scope with no teardown. pirateiro was the one root
NOT in tests/conftest.py _POLLUTING_ROOTS, so
_isolate_download_proxy_modules' per-test snapshot captured it and the
leak persisted to every later tests/unit/ test. Benign in the current
suite (real module, no other importer) but a latent masking hazard.

Root cause (§11.4.6 / §11.4.102 — investigated, not guessed)

Because the stub is in sys.modules BEFORE any per-test snapshot,
simply adding pirateiro to _POLLUTING_ROOTS does NOT fix it — the leak
is already inside each test's saved snapshot, so the restore re-adds it.
Deferring the injection into a helper broke 22 tests whose
@patch("pirateiro.retrieve_url") decorators resolve the target before
the test body.

Fix (conftest-only)

Cache the stub on first sight (`_PIRATEIRO_STUB`), re-register it before pirateiro-file tests (so their `@patch` setup resolves), and purge it on teardown of every unit test. `tests/unit/test_plugin_pirateiro.py` left byte-identical.

RED → GREEN evidence (§11.4.115 polarity switch)

- RED command: `.venv/bin/python -m pytest tests/unit/test_plugin_pirateiro.py tests/unit/test_pirateiro_isolation_guard.py -p no:randomly -q --import-mode=importlib`
- RED (pre-fix): `AssertionError: sys.modules['pirateiro'] leaked into this test (value: <module 'pirateiro' from '../plugins/community/pirateiro.py'>)` → **1 failed, 44 passed**
- GREEN (post-fix, same command): **45 passed in 0.65s**
- Negation proof (§11.4.115): with the `sys.modules.pop("pirateiro", None)` teardown line disabled, the guard FAILS again (1 failed, 44 passed); restored → passes. The guard is not a tautology.
- Full unit suite (default seed): **4122 passed, 3 warnings in 266.03s** (4121 + 1 new guard)
- Full unit suite (`--randomly-seed=42`): **4122 passed, 3 warnings in 269.13s** (order-independent)

Standing regression guard (§11.4.135)

`tests/unit/test_pirateiro_isolation_guard.py` — permanent test asserting "pirateiro" not in `sys.modules` at the start of a fresh unit test; FAILS pre-fix, PASSES post-fix.
