

SESSION_RESUME_20260822

Session resumption state — 2026-08-22 (weekly quota reset: Aug 24, 21:00 Europe/Belgrade)

Two agents were killed mid-work by the WEEKLY limit. Per §11.4.147(e) quota exhaustion is a first-class CRASH class, not a completion: both stay owed and must be respawned, resuming from their exact last point. Neither is written off.

OWED RESPAWNS (do these first)

1. BOB-173 review — agent a488b247ad3fb4770

Last line: “234 passed — matches the author’s claim. Final checks: signal-safety, lint, and the theme_state atomic-write reference for the A5 scope judgement.” So it had already re-run the suite and confirmed the author’s count; what remains is §11.4.263 signal-safety, lint, and its judgement on A5 (non-atomic write). The full review brief is in this session’s transcript. Key unfinished asks: - verify BOTH permission seals genuinely seal on THIS filesystem as THIS user (seal_for_create -> dir 0500, seal_for_rewrite -> file 0400). If either is a no-op the corresponding RED is still false and the problem only moved. - confirm the §11.4.120 reconciliation of test_hooks_remaining.py is a genuine reconciliation, not a weakening (that test previously ENCODED THE DEFECT as the contract). - author a mutation the author did not write.

2. BOB-166 re-review — agent ad99f9c240930a7d8

Last line: “Starting the re-review. First, verify the two unchanged files against my recorded baselines and read the grown test file.” It had not yet re-verified anything this round. Its round-1 verdict was NO-GO on IMPORTANT-1 (R4 mutation: guard read raw status instead of normalized); the author has since fixed it with a table-driven {input, normalizesTo} loop covering BOTH non-canonical routes, and reports R4 now dies diagnostically (canonical four still pass, the three new cases fail). Round-2 asks: re-run R4, author a fifth mutation against the new loop, check the MINOR-2 Operator-blocked scoping, and confirm 272 PASS / 1 FAIL / 3 SKIP.

UNCOMMITTED WORK IN THE TREE (do not lose)

- constitution/scripts/workable-items/{mutate.go, sync.go, cmd/workable-items/update_location_status_invariant_test.go} — BOB-166 fix, remediated, awaiting the round-2 review above. NOT committed.
- download-proxy/src/api/hooks.py, tests/unit/api_layer/test_hooks_remaining.py, tests/unit/api_layer/test_bob173_hook_persistence_failure.py — BOB-173 fix, awaiting the review above. NOT committed.

SEQUENCING FACT ESTABLISHED THIS SESSION (load-bearing for BOB-166)

pre_build_verification.sh resolves the git-TRACKED prebuilt at constitution/scripts/workable-items/bin/workable-items (built Aug 19). That stale prebuilt was EXECUTED against a DB copy: 0 findings, exit 0. No boba gate runs `go test` on that module. Therefore landing the BOB-166 SOURCE reddens no boba seam — the gate only goes red once the tracked binaries are rebuilt and committed, which must be sequenced against draining the ten rows (BOB-166 acceptance (c)). This is the §11.4.108 layer-2 state: source present, artifact absent. Also: invariant 17’s comment claiming “bin/ is a gitignored dir nothing ever populated” is STALE — the prebuilds exist, are tracked, and are preferred.

SHIPPED THIS SESSION (all after full adversarial review loops, all pushed x3)

BOB-111 rate limiter (3 rounds) · BOB-135 test-isolation guard (2 rounds) · BOB-093 ReDoS bounds (3 rounds) · BOB-109 scaling suite (5 rounds). Closed: BOB-079, BOB-092, BOB-136, BOB-158.

STILL OWED, NOT STARTED

- Quiescent long-gate re-run. The one full run this session completed 42/45 with its three failures triaged: docs_chain (real, fixed), mtime-moved (NOT a defect — three tracked files moved mid-run, mine plus two agents'), and CM-RUNTIME-DEPS-PARITY (real, pre-existing, BOB-154). That verdict CANNOT inform a release decision; it needs a quiescent tree.
- BOB-154 venv rebuild — now unblocked (BOB-158 landed) but .venv was in use all session by pytest-running agents (§11.4.119).
- BOB-170 quiescent GREEN run of the scaling timing gates.
- BOB-169 export fix: ONE flag (-s at generate_markdown_exports.sh:57) plus a FORCED regeneration of ~286 HTML and their PDFs, HTML BEFORE PDFs. Deferred deliberately: 600 files during parallel dispatch is a §11.4.84 collision.

OPERATOR DECISIONS OWED

BOB-162 brownfield adoption · BOB-163 does-a-429-count-as-responsive · BOB-166 acceptance (c) sequencing (drain the ten rows vs rebuild the binaries) · :7186 and :7189 deployments (§11.4.235, Hard Stop #3 — orchestration is the operator's).

SECOND QUOTA INTERRUPTION — 2026-08-22, session limit (resets 15:30 Europe/Belgrade)

Two REVIEWERS killed mid-work. Same §11.4.147(e) treatment: crash class, work stays owed, resume from the exact last point. Both had made real progress.

3. BOB-168 review round 2 — agent a763dbd65e4d562e1

Last line: “M5 confirmed dead at case 4b. Job 3: the seventh (reviewer-authored) mutation set against the NEW guard itself, both in isolated trees.” So jobs 1-2 are DONE — the fail-open fix and the precedence guard are confirmed. What remains: its own seventh mutation against the new guard (suggested shapes: make the guard’s -f check pass on a directory; make RC=97 collide with a real runner exit code; make case 4b’s roster incomplete so it silently stops exercising precedence), plus export-twin freshness and the sibling-untouched check. Round-1 verdict was NO-GO on B-1 (the test could fire the REAL DDoS bank via `cd ""` succeeding as a no-op) and I-1 (FAIL>MISSING precedence unguarded). Both fixed and reproduced by the author before fixing.

4. BOB-172 review — agent a4c8ca7e6d328e7f1

Last line: “Full suite green (883 passed — one more than the author’s 882, zero failures; count drift is benign). Now the RED reconstruction: swap in HEAD’s pre-fix search.py, run, restore byte-identical.” So the GREEN half is independently confirmed. What remains: the RED reconstruction against pre-fix search.py, then the two disclosures it was asked to judge — (1) the deliberate `_search_one` error-propagation change that revives a dead `captcha_required` branch at `api/routes.py:727`, and (2) the edited `_FakeResp` stub in `test_nnmclub_session_login.py` — plus its own reviewer-authored mutation and the five-site drift check.

LANDED SINCE THE FIRST RESUME DOC WAS WRITTEN

- BOB-173 committed (GO, zero blocking/important). Both permission seals proven to genuinely seal; the false-RED mechanism confirmed empirically.
- BOB-166 committed IN THE SUBMODULE as 71589d5 and pushed to all upstreams (origin fans out to 8 push URLs; named remotes report up-to-date). PARENT POINTER BUMP was in progress when the limit hit — verify it landed, and if not, commit constitution (pointer 16b67b0..71589d5) in the parent.
- BOB-168 and BOB-172 fixes are complete and remediated, awaiting only the two reviews above.

KNOWN-RED, DELIBERATELY, IN THE CONSTITUTION SUBMODULE

go test ./cmd/workable-items/ has exactly ONE top-level failure: TestValidate_OK_RealDocs. That is the new gate correctly reporting the ten pre-existing stranded rows in the consumer's trackers — causation proven (under the gate-stubbing mutation the test passes). Draining needs per-row evidence and is tracked; weakening the gate would be §11.4.120 fake-passing; an exemption baseline would embed consumer literals in a shared engine AND pre-empt a §11.4.224(E) operator decision. Where a consumer has no such trackers the test SKIPS loudly. Do not “fix” this by touching the gate.

**FILED SINCE: BOB-174 (hooks corrupt-load
data-loss chain), BOB-175**

**(one-directional update guard), BOB-176
(cookies-only rutracker never enabled)**

A CORRECTION I OWE THE RECORD

BOB-168's original filing was MINE and its premise was FALSE. I measured challenges/scripts/ while the runner reads submodules/challenges/challenges/scripts/ — two similarly-named directories, wrong one measured (§11.4.201(9) field identity), and I wrote “verified by invocation” having only listed a directory. The item is corrected in-place. The generalisable lesson, which is not in §11.4.201(7)(b) as commonly applied: A CONTROL NEEDLE PROVES THE INSTRUMENT CAN SEE; IT DOES NOT PROVE IT IS POINTED AT THE THING UNDER TEST. I applied a needle correctly to a sibling's work in the same commit, then omitted it on my own measurement one paragraph later.
