Recording verdict — boba-ctl orchestrator CLI

Revision: 1 Last modified: 2026-06-16T00:30:00Z

§11.4.83 recorded-evidence + §11.4.153 video-confirmation + §11.4.107/§11.4.117 on-screen verification. Analysis performed by Claude Opus 4.8 vision (operator- chosen analysis path — the HelixAgent ensemble vision endpoint is a proven stub, see docs/qa/recording-readiness-20260615/).

Recording

- **Surface:** CLI — boba-ctl (Go orchestrator, cmd/boba-ctl/main.go)
- **Artifacts** (external per operator, /Volumes/T7/Downloads/Recordings/): boba-cli-orchestrator-demo.cast / .gif / .mp4 (14.1s)
- **Scenario:** live stack — boba-ctl status → health → list
- **Pipeline:** asciinema rec → agg (gif) → ffmpeg (mp4) → ffmpeg fps=1 frames → Claude vision

Frame-by-frame verdict (real on-screen content, no bluff)

Feature	Frame	On-screen result	Verdict
boba-ctl status	frame_04	NAME/STATE/HEALTH/PORTS table; qbittorrent, jackett, boba-	PASS

Feature	Frame	On-screen result	Verdict
		jackett, download- proxy all running	
boba-ctl health	frame_13	4 services all OK	PASS (see  note)
boba-ctl list	frame_13	4 default services + go profile (qbittorrent- proxy-go) + Runtime: podman	PASS 
banner	frame_13	“=== demo complete — 4 services running & healthy ===”	PASS

Honest observation (not a failure → tracked follow-up)

health/status show - / “no ports exposed” in the HEALTH/PORTS detail for ALL four services because they use `network_mode: host` (no published ports), and the Go health checker probes *published* ports. `STATE=running / STATUS=OK` is correct (containers ARE up and search works). Follow-up: make the health checker probe the in-VM listening port for host-net services so DETAIL reflects a real endpoint probe rather than “no ports exposed”.

Outcome

boba-ctl orchestrator features confirmed working on-screen. No problems requiring a fix detected (the health-detail gap is cosmetic, tracked above).
