GamesTorrents silent-zero + slow-upstream investigation

Revision: 1 **Last modified:** 2026-06-16T00:00:00Z **Status:** investigation complete — recommendations; clear bugs being fixed, tuning/removal deferred to operator (§11.4.122).

Real probes: merge service nezha:7187 /api/v1/search/sync (user path) + direct curl from nezha. §11.4.6 FACT-only; §11.4.123 captured proof. Container FACT: PUBLIC_TRACKER_DEADLINE_SECONDS=15 (code default 60, clamp 5–120).

1. gamestorrents — PARSE-FAIL (site alive, regex matches zero) → BUG, fixing

Scoped GTA → empty/0/no-error/~1.2s. Direct ?s=GTA → HTTP 200, <title>Has buscado GTA, real GTA V result (gta-v.jpg, 59.03 GB). Root cause: the plugin parse regex anchors on <article>+<h2>+<div class=size/date> — the current site has **0 <article>, 0 <h2>**; results moved to <table class="table metalion"> rows (<td><a href>NAME</td><td>DATE</td><td>SIZE</td>...). **Action: fix-regex (article-card → table.metalion). NOT niche, NOT dead.**

2. Slow upstreams

Tracker	Live	Returns?	TTFB/ total	Merge verdict	Recommendation
tokyotoshokan	unstable (200/500)	YES (7)	12.8–14.6s	success ~14.6s (borderline)	raise deadline (~25–30s) —

Tracker	Live	Returns?	TTFB/ total	Merge verdict	Recommendation
yourbittorrent	522 origin-down	NO	~19.8s, 522	deadline_timeout/ 0	operator tuning call mark-dead candidate (re- probe; §11.4.122 operator)
torlock	alive 200	YES (100)	0.65–12.5s	success 100	leave / raise deadline

Cross-cutting: PUBLIC_TRACKER_DEADLINE_SECONDS=15 is the dominant cause of the tokyotoshokan + torlock timeouts (both return real results just above/around 15s). Raising to ~25–30s recovers both at a modest full-fleet-latency cost; it does NOT help yourbittorrent (origin 522). The 15s value was set deliberately (latency trade-off) — raising it is an **operator tuning decision**, documented here, not changed autonomously. yourbittorrent removal is **operator-reviewed (§11.4.122)**.

Captured 2026-06-16 against nezha + the live tracker domains.
