

BOB-084 closure evidence

Item: BOB-084 (RD2-17) "Reconcile BOB-008 DB/MD body drift via the workable-items tool" **Type:** Task **Closed as:** Completed ("Fixed.md") per §11.4.33 **Closed:** 2026-08-21

Acceptance criterion (from the item's own body_md)

Reconcile BOB-008 DB/MD body drift (RD2-04) via the workable-items tool.

RD2-04's own evidence line, from docs/
GOVERNANCE_AUDIT_2026-08-08_ROUND2.md:

~ BOB-008 body differs (md=703 bytes db=576 bytes)

Verdict: ALREADY SATISFIED "the drift was reconciled at 443e938, via the tool"

The work landed under a commit whose message did not carry the ATM id, so the row was never reconciled "the same drift class recorded for BOB-076 / BOB-091 / BOB-117. 443e938 docs(governance): Session 15 sync " audit round 2, BOB-008 fix, Track 11, doc exports states it verbatim in its own body:

docs/Issues.md + docs/workable_items.db: BOB-008 DB<->MD body drift fixed via workable-items sync md-to-db

That names the engine, which is what the acceptance criterion requires.

Verification "re-derived independently, not inherited from the commit message"

1. RED "the exact RD2-04 finding reproduces at the commit it was filed against (§11.4.199)

Same instrument, same flags, materialising 54e313f's tracked DB + Markdown into a temp tree:

```
$ workable-items diff --db db.sqlite --issues Issues.md --fixed Fixed.md
~ BOB-008 body differs (md=703 bytes db=576 bytes)
diff: 1 difference(s) (compared 63 Markdown item(s) against 63 DB item(s);
```

Byte-for-byte the audit's line. The defect was real and the instrument sees it.

2. GREEN “ the same command at HEAD

```
$ workable-items diff --db docs/workable_items.db --issues docs/Issues.md
diff: DB and Markdown are in sync (compared 157 Markdown item(s) against 1
```

The verdict names the two files it read “ the BOB-155 fix. The flagless form was never used as evidence here; it opens zero Markdown files and its clean verdict is worthless.

3. The reconciliation commit, located by bisecting the instrument over history

Every commit touching the tracker between 54e313f and 3eaf39a was materialised and re-measured. 54e313f drifted; 443e938 is the first commit that reads clean at the same 63-item count:

```
54e313f ~ BOB-008 body differs (md=703 db=576)      <- RD2-04 filed here
443e938 in sync (63 vs 63)                          <- reconciled here, v
```

4. Per-item byte comparison at HEAD “ not just the aggregate verdict

```
BOB-008 DB body_md : 1334 bytes sha256 146aee858776599c
BOB-008 Issues.md : 1333 bytes sha256 9f1119e30cd212ee
normalised diff (trailing blank lines stripped both sides): IDENTICAL
```

The one-byte delta is the section’s trailing newline, which the extractor includes and the column does not. Control needle on the same extractor against a deliberately different item returned a difference, so the “identical” reading is not a blind zero (Â§11.4.201(7)(b)).

5. The clean verdict is not a FALSE-NULL “ the oracle is proven able to see BOB-008 drift

workable-items diff is structurally blind to body-only drift (that blindness is BOB-136). The independent re-parse oracle in scripts/hooks/docs-sync-commit-seam.sh is not, and its Â§11.4.107(10) self-test happens to pick BOB-008 as its golden-bad victim “ the first Issues item by id with a body over 40 bytes. So the needle is seeded into *this very item*:

```
$ bash scripts/hooks/docs-sync-commit-seam.sh --self-test
golden-good      PASS (clean tree reproduces tracked DB; oracle does not f
golden-bad       PASS (seeded body drift DETECTED and named: BOB-008)
self-test PASS “ oracle validated in both polarities
```

An instrument that detects seeded drift in BOB-008 and then reports none is reporting absence of drift, not absence of sight.

6. Standing checks at HEAD

```
$ workable-items validate --db docs/workable_items.db
validate: OK " 157 items, all invariants satisfied"
```

```
$ bash scripts/hooks/docs-sync-commit-seam.sh --files docs/Issues.md docs/
CHECK 1 workable-items validate ..... PASS
CHECK 2 workable-items diff ..... PASS
CHECK 3 body_md drift oracle ..... PASS
```

Honest boundary (§11.4.6)

This closes the one-time reconciliation only. The *mechanical prevention* of the class is BOB-087's scope, which remains open on its third seam " see docs/qa/BOB-087/.
