

Status_Summary

Boba — Feature Status Summary

Revision: 6 **Last modified:** 2026-06-16T18:30:00Z **Scope:** Two-audience summary companion of docs/features/Status.md (§11.4.56). Page 1 = product/operator audience; Page 2 = software-engineer audience.

Captured-evidence-driven (§11.4.5 / §11.4.45 / §11.4.56 / §11.4.86). Mirrors Status.md — when that file changes, regenerate this one (see .docs_chain/contexts/features-status.yaml).

Page 1 — For the product / operator team

What Boba does. Boba turns qBittorrent into a multi-tracker search-and-download hub. You type one query; it searches 40+ public and private torrent trackers at once, removes duplicates, adds posters and metadata, and lets you add any result to qBittorrent with one click — from a web dashboard, from a browser extension, or via a themed WebUI proxy.

What works today (default product — Python/FastAPI on :7187 + :7186): - Multi-tracker search with live streaming results, de-duplication, and metadata enrichment (posters, year, type from OMDb/TMDB/TVMaze/AniList/MusicBrainz/OpenLibrary). - One-click add-to-qBittorrent, magnet copy/open, .torrent upload, and active-downloads view. - The Angular dashboard (search grid, magnet dialog, theme picker, qBit login, Jackett management tabs) and the BobaLink browser extension (detects magnet/.torrent links on any page, “Send” / “Send-All” to Boba) are both shipping and heavily tested (the extension alone has 559 passing tests). - Jackett indexers are auto-configured at startup; credentials live encrypted in a local database, edited from the dashboard’s Jackett page (boba-jackett service on :7189). - Private-tracker support (RuTracker, Kinozal, NNM-Club, IPTorrents) works through the WebUI bridge and download proxy.

What’s partial or pending: - **RuTracker login needs a human** — it has a CAPTCHA, so automated login is operator-assisted (paste a cookie or solve the CAPTCHA once). This is a real-world limit, not a bug. - **A few security hardenings are queued** — some write endpoints are open by default on the LAN tunnel, and a couple of fetch paths need SSRF protection (tracked as RW-01..RW-05 in the remaining-work plan). An operator decision on LAN exposure gates how aggressive these need to be. - **One private-tracker status route (NNM-Club)** needs a container redeploy to go live (a source-vs-running drift, RW-07). - **The RuTracker ReDoS speed fix** is in the code but needs to be pushed into the running container

(RW-06). - **The Go backend is an opt-in preview, not the product** — it replicates the API shape but is missing real plugin search, enrichment, and a working scheduler. The Python backend is the complete one.

What you (the operator) may need to act on: - Decide whether the LAN tunnel should stay open (0.0.0.0) or bind to localhost (RW-05). - Solve the RuTracker CAPTCHA once when private RuTracker search is needed (BOB-008). - Decide whether the Go profile parity is a release goal (RW-09).

Honest note on testing depth: every feature in this catalog is backed by a real source file and, in nearly all cases, an automated test. Each of the 288 rows now carries a DEFINITIVE video status (no row left vague): **28 are VIDEO-CONFIRMED** — shown on-screen in a committed recording (the boba-ctl CLI status/health/list, the web dashboard search journey + tab navigation + qBit/Download buttons + theme + processing spinner + bridge/qBit-Connected header indicator + Jackett credentials page & Add-credential dialog, and the BobaLink extension scan/popup/options) (docs/qa/recordings-20260615/); **246 are N/A (no UI)** — back-end endpoints, handlers, parsers, services and scripts that have no screen of their own and are confirmed by their tests plus the UI/CLI journey that drives them; **14 are PENDING (UI — film next)** — user-visible dialogs/controls (magnet dialog, qBit login dialog [can't be shown without logout — qBit is already connected], confirm/tracker-stat dialogs, the Jackett indexer dialogs/tabs) not yet *individually* filmed. The 14 PENDING-UI items are the remaining visual-confirmation pass.

Page 2 — For software engineers

Inventory method (2026-06-15, expanded 2026-06-16): read-only codegraph + grep + source reading across the repo, then expanded to per-unit granularity (§11.4.118). **288 features cataloged** across 8 components (was 135 at Rev 2 — finer granularity, one row per real endpoint/handler/client-method/component-control/plugin/subcommand/script). Every row in Status.md cites a source file (file:line where load-bearing), endpoint, command, or control. No invented features (§11.4.6).

Component / feature counts + posture:

Component	Path / port	Features	Posture
Download Proxy + Merge Search (Python/ FastAPI)	download-proxy/ src :7186/:7187	68	Shipped default; nearly all tested-green-in-suite. Now itemized per route (search/auth/hooks/schedules/theme/download), per dedup tier, per enrichment source, per validator. Open gaps: hooks auth (RW-01), default-open write surface (RW-02), SSRF (RW-03), magnet auth (RW-04); validator (BEP48/15) has no dedicated test; Kinozal/

Component	Path / port	Features	Posture
qBitTorrent-go (Go/Gin)	qBitTorrent-go :7186/7187/7188 opt-in	47	IPTorrents have no REST auth route. Skeleton; unit-only (go test). Itemized per handler/client-method/service. DownloadHandler mock-only, ActiveDownloadsHandler empty stub, FetchTorrent stub; scheduler has no driver loop (RW-10, never fires); enricher missing (RW-11); SSE broker defined-but-unwired.
boba-jackett (Go)	qBitTorrent-go/cmd/boba-jackett :7189	26	Implemented; unit + integration + e2e + security (go). Itemized per endpoint + autoconfig engine/matcher/client + crypto/migrate/repos/bootstrap/envfile. Encrypted SQLite (AES-256-GCM), autoconfig, runs history, overrides, admin auth, hardened CORS.
Tracker plugins	plugins/*.py	30	One row per real plugin present in tree (21 with matching file) + support modules. Parser sweep stress-chaos coverage. rutracker ReDoS fix not yet deployed (RW-06). CORRECTION: install-plugin.sh PLUGINS array has 44 entries, not 12; ~23 (incl. torrentproject/torrentscsv) are curated names with no file in this tree — itemized as discrepancy rows, not asserted working.
Angular 21 frontend	frontend/ served :7187	34	Vitest unit + Python Playwright/integration; signals-based; 40% coverage floor. Itemized per dashboard control (search/grid/5 tabs/ qBit+Download/magnet/theme/auth chips), per

Component	Path / port	Features	Posture
BobaLink extension	extension/ (WXT MV3)	39	dialog, per service, per Jackett page control. Per docs/ browser_extension/ Status.md; unit/ integration/security/chaos/ perf/allly/live; built zips present. Itemized per popup control, scanner, parser, api module, shared util, and 8 locales (en/de/es/fr/it/ja/pt/ ru).
WebUI bridge	webui-bridge.py :7188 host	4	Integration + stress-chaos; private-tracker auth live- gated. Itemized: boba-ctl 5 subcommands + wrapper, lifecycle scripts, CI/test wrappers, and the full scripts/ helper set. CORRECTION: boba- ctl.sh DOES exist (scripts/boba-ctl.sh), Rev 2 said it did not. Several scripts un-validated (no dedicated test).
Infra / CLI / scripts	repo root + scripts/	40	

Key evidence anchors (file:line): - FastAPI routes: download-proxy/src/api/routes.py:61-1261, auth.py:56-532, hooks.py:105-179, scheduler.py:39-126, __init__.py:168-347. - Orchestration: download-proxy/src/merge_service/search.py (semaphores, subprocess fan-out, _classify_plugin_stderr); deduplicator.py (tiered); enricher.py:113 (6 providers); validator.py:101/162 (BEP48/15). - Go routes: qBitTorrent-go/cmd/qbittorrent-proxy/main.go:54-100; jackett internal/jackettapi/router.go + *.go handlers; internal/db/crypto.go, repos/*.go. - Frontend: frontend/src/app/components/{dashboard,magnet-dialog,qbit-login-dialog,theme-picker,tracker-stat-dialog}/, services/{api,sse,theme,toast,dialog}.service.ts, jackett/{credentials,indexers}/. - Extension: extension/src/{api,scanner,parser,popup,options,tabgroups,shared}/.

Test corpus locations: Python tests/
{unit,integration,e2e,security,stress,chaos,property,contract,concurrency,memory,observability,benchmark,performance,load,docs}/; Go qBitTorrent-go/internal/**/*_test.go + tests/
{contract,e2e,integration,security}; frontend frontend/**/*_spec.ts + e2e/; extension extension/tests/
{unit,integration,security,chaos,perf,a11y,e2e,live,i18n}.

Open work cross-reference: docs/REMAINING_WORK_PLAN.md RW-01..RW-21 + BOB-008 (operator-blocked CAPTCHA).

Engineering follow-ups for this doc: - The Video column is now DEFINITIVE for all 288 rows (28 VIDEO-CONFIRMED / 14 PENDING-UI / 246 N/A-no-UI). Remaining UI evidence gap = the 14 PENDING (UI – film next) rows (magnet/qBit-login/confirm/tracker-stat dialogs + Jackett indexer dialogs/tabs); film those per §11.4.107/§11.4.143 to close it. The 246 N/A rows are back-end/script units with no screen of their own (test-covered + exercised by the confirmed UI/CLI journeys) — not a recording gap. - Confirm whether a Prometheus /metrics endpoint exists or stats are in-process only (GET /api/v1/stats) — no Counter()/Histogram()/Gauge() definitions found in download-proxy/src. - Resolve the curated-name-vs-missing-file discrepancy for the ~23 plugins in the 44-entry install-plugin.sh array with no plugins/*.py (incl. torrentproject/torrentscsv). - Wire the Go DownloadHandler/ActiveDownloadsHandler/FetchTorrent stubs + scheduler driver loop (RW-10/RW-11) before the Go profile can claim parity.
