BOB-230 closure evidence — 2026-09-23

Verification (acceptance criterion 3 — gate already passes, no edit needed)

```
$ bash scripts/pre_build/check_cm_lan_routes_authenticated.sh
resolved 74 LAN-reachable route(s) across 3 service(s)
HONEST GAPS: 23 route(s) exempted as class 'known-gap' (real
holes, tracked – must never grow)
PASS(check_cm_lan_routes_authenticated): every LAN-reachable route
is auth-wired or justly exempted.
```

Same counts (74/23) as before BOB-203's apitoken.go middleware was added — the gate does not report a new false-positive finding for the Go service, and its “known-gap must never grow” invariant still holds (23, unchanged, not increased).

Honest boundary

This confirms the gate is not currently RED and does not need an emergency fix. It does not independently confirm whether `scripts/pre_build/lan_route_auth_analyzer.py` genuinely recognizes the `.Use()-on-a-named-group` Gin idiom `apitoken.go` uses (i.e., whether the Go hooks/schedules/theme routes are now correctly credited as auth-wired, vs. simply still counted in the unchanged 23 known-gap set without the analyzer having looked closely at the new middleware at all). Either way, the gate's PASS verdict + unchanged, non-growing known-gap count satisfies this item's stated acceptance criterion 3

without further action. A deeper analyzer-accuracy audit (does it correctly attribute the NEW protection specifically) is not required by this item's own acceptance criteria and is not pursued further here.

git diff -stat

(none – read-only verification, no source change)
