BOB-135 — closure evidence: full bulk-suite verification (2026-09-25)

Item: BOB-135 — Test isolation: `test_list_hooks_after_create` fails in bulk suite (Permission denied /config).

Fix (already landed, prior session): commit

dc85a9a25d772bd95037428b71ee7fcfb38ef42e — fix(BOB-135): the permanent guard for a defect that hid behind a swallowed exception. Root cause: importing `api.hooks` sets both `sys.modules["api.hooks"]` and `sys.modules["api"].hooks`; a test that purges and re-imports (`api_layer/test_hooks_coverage.py`) repoints both at a fresh module, and under `pytest 9.1.1`'s `monkeypatch.resolve()` this silently desynced the two references for the rest of the session, causing a later test's write to hit a stale module whose fixture-patched `/config` path had already been torn down — surfacing as a misleading `PermissionError: /config` (the swallowed exception's side effect, not its cause). Guard added: `tests/unit/test_module_attr_isolation_guard.py`.

This round's verification task: confirm the fix holds under the actual adversarial condition it targets — bulk-suite execution with randomized test order (`pytest-randomly`) across the FULL unit suite, not just the guard file in isolation.

Command

```
timeout 2700 .venv/bin/python3 -m pytest tests/unit --import-mode=importlib -q \
  --timeout=60 -p randomly --randomly-seed=12345 -rf
```

Result

```
FAILED tests/unit/
test_bob129_slowapi_response_contract.py::TestDecoratedEndpointCont
FAILED tests/unit/
test_bob192_fail_open_skip_remediation.py::test_download_magnet_fa:
2 failed, 5027 passed, 4 skipped, 5 warnings in 1645.72s (0:27:25)
```

BOB-135's own tests are NOT in the failure list —

test_list_hooks_after_create (tests/unit/api_layer/ test_hooks_endpoints.py) and test_module_attr_isolation_guard.py (the new permanent guard) both ran and passed among the 5027 passed, under this exact adversarial random-seed bulk-suite ordering that originally exposed the defect. `pytest -q` prints only `.` for a pass and an explicit `FAILED` line per failure — their absence from the `FAILED` list is the positive evidence, cross-checked against the `-rf` (re-list-failures) summary which enumerates every failure by name.

The 2 unrelated failures — investigated, not waved past (§11.4.4)

Both failures reproduce in isolation (order-independent, not a bulk-suite artifact) and are genuine, pre-existing regressions on already-closed items, unrelated to BOB-135's defect class:

1. **BOB-129 regression** (reopened + refixed this session, see docs/qa/BOB-129/reopen_20260925.md): commit 1ef4246 (BOB-167) decorated `stream_theme` with `@_rl("sse_stream")` without adding it to BOB-129's `_RESPONSE_RETURNING_EXEMPTIONS` set. Fixed by adding the exemption entry (the endpoint's single return path is a `StreamingResponse`, same shape as the already-exempted `search_stream`). RED→GREEN→RED→GREEN proof in the linked evidence file.
2. **BOB-241 test-wiring drift** (new item, filed + closed this session, see docs/qa/BOB-192/test_wiring_fix_20260925.md): BOB-234 added a mandatory `api_token` fixture parameter to `TestDownloadEndpoint.test_download_magnet_added_to_real_qbittorrent`; a direct plain-call site in `test_bob192_fail_open_skip_remediation.py` (bypassing `pytest` fixture injection) was never updated. Fixed by passing a placeholder token (the mock server performs zero token validation).

Both fixes independently re-verified by the conductor: combined run of both touched files —

27 passed, 1 warning in 12.06s

Verdict

BOB-135's fix holds under the exact adversarial condition (bulk-suite, randomized order, full unit tree) that originally exposed the defect. The two other failures surfaced by the same run were unrelated pre-existing regressions, independently root-caused, fixed, and verified this session.

Closing BOB-135 as Completed.
