BOB-150 closure evidence — 2026-09-23 (staleness-corrected closure)

Original defect

Stored description (“N/44, 35 labelled”) reflects an old measurement — the script has grown substantially since filing.

Current state (independently verified, 2026-09-23)

Every top-level `pre_build_verification.sh` invariant label now consistently uses `[N/56]`, complete and sequential (1 through 56, including `[56/56]`). A SEPARATE, intentional inner loop (invoking the constitution submodule’s own gate scripts, e.g. `[33/52] CM-CLI-AGENT-PLUGINS-WIRED -> constitution/scripts/gates/...`) computes its OWN dynamic `/N` denominator at runtime from the live count of gate scripts it invokes — this is NOT a static string in the source (`grep` for a literal `/52` in source returns 0 hits), so it does not represent an inconsistent/stale label the way the original defect described; it is a deliberate two-tier structure (56 top-level invariants, one of which fans out into a dynamically-sized inner gate-invocation loop).

Status

Fixed (the original inconsistency is resolved by the script’s current structure). Closed by coordinator after independent re-verification.
