BOB-152 closure evidence — 2026-09-23

Defect

The constitution sweep (config/constitution-sweep.conf driving scripts/verify-all-constitution-rules.sh) passed --root @ROOT@ to most gates with no exclusion, so cm_oracle_strategy_named_and_independent, cm_killpg_pgid_guard, and cm_test_mock_pid_explicit_int walked submodules/ (vendored third-party code) — measured 82%/88% of one gate's tens of thousands of findings originating there, burying first-party findings under noise.

Fix

All three gates already had their own env-var-driven exclude mechanism (ORACLE_GUARD_EXCLUDE/KILLPG_GUARD_EXCLUDE/MOCK_PID_GUARD_EXCLUDE, identical shape to the dangerous-combination gate's own). submodules is now appended to the already-wired _BOB143_SWEEP_EXCLUDE base (renamed _BOB152_VENDORED_EXCLUDE), applied ONLY to these 3 gates — DANGEROUS_COMBO_EXCLUDE deliberately left untouched (different gate, out of scope). config/constitution-sweep.conf needed no edit — the exclude wiring lives in scripts/verify-all-constitution-rules.sh directly.

Independent verification (coordinator, from clean shell)

```
$ bash tests/pre_build/test_bob152_vendored_exclude_scope.sh
wiring confirmed: MOCK_PID_GUARD_EXCLUDE / ORACLE_GUARD_EXCLUDE /
```

```
KILLPG_GUARD_EXCLUDE all read $_BOB152_VENDORED_EXCLUDE
confirmed OUT OF SCOPE preserved: DANGEROUS_COMBO_EXCLUDE is still
bound to $_BOB143_SWEEP_EXCLUDE, not $_BOB152_VENDORED_EXCLUDE
---- killpg ----
PASS: with BOB-152 exclude active, submodules/-rooted probe
EXCLUDED (0 hits), tests/-rooted control STILL CAUGHT (1 hit(s)).
---- oracle ----
PASS: with BOB-152 exclude active, submodules/-rooted probe
EXCLUDED (0 hits), tests/-rooted control STILL CAUGHT (1 hit(s)).
---- mock_pid ----
PASS: with BOB-152 exclude active, submodules/-rooted probe
EXCLUDED (0 hits), tests/-rooted control STILL CAUGHT (1 hit(s)).
VERDICT: PASS – BOB-152 exclude is load-bearing for all 3 affected
gates.
```

Instrument viability proven for all 3 gates (both submodules/-rooted and tests/-rooted synthetic violations detected BEFORE the exclude is active), then the exclude proven load-bearing (submodules/ dropped, tests/ still caught) — not a blind zero.

Honest gaps disclosed (not fixed here, correctly out of scope)

cm_killpg_pgid_guard’s full-root unfiltered total was not fully measured (runtime budget) — the fix’s correctness does not depend on that number, only on the mutation-proof above. The gate’s own “self-reference carrier” concern (golden-bad fixtures counted as findings) investigated and found largely already resolved; 9 remaining first-party findings recommended as a smaller, separate follow-up (not this item’s scope).

Status

Fixed. Closed by coordinator after independent re-verification.
