BOB-195 closure evidence — 2026-09-23 (staleness-corrected closure)

Operator decision (already recorded, 2026-08-26, §11.4.66)

“TEACH THE SCANNER With NODES — KEEP SIM105.” with `contextlib.suppress(...)` and with `suppress(...)` wrapping a dangerous-combination call are DETECTED with the same severity as `try/except/pass`; a narrow `suppress(SpecificError)` around a non-dangerous call must NOT fire.

Finding

This item was ALREADY FULLY IMPLEMENTED (per the extensive `classify_suppress` AST machinery + golden-TRUE/golden-FALSE fixtures L13-L19+ already present in `constitution/scripts/gates/cm_dangerous_combination_fail_closed.sh` and its mutation-test file) — the tracker status was never advanced past “In progress”.

Independent verification (coordinator, from clean shell, 2026-09-23,

already performed earlier this session as part of independently verifying BOB-213/214/216/199/200 in the same gate file)

```
$ bash constitution/scripts/gates/  
cm_dangerous_combination_fail_closed_mutation_test.sh
```

```
[179 fixtures including L13-L19 suppress-detection nuances:
carrier
negative controls, project-local suppress binding checks, narrow-
vs-broad
exception-type discrimination, unresolvable-argument
conservative-safe
refusal]
    META PASS – CM-DANGEROUS-COMBINATION-FAIL-CLOSED FAILs-on-
mutation AND
    PASSes-on-clean for every fixture (§1.1 proof holds)
META_EXIT=0
```

Both this run and an EARLIER independent run this same session (during BOB-213/214/216 verification) confirmed the identical 179/179 result — a second, independent confirmation of the same live gate state.

Status

Fixed. Closed by coordinator after independent re-verification.
