BOB-178 closure evidence — 2026-09-23

Fix

`_search_kinozal`'s login-response handling in `download-proxy/src/merge_service/search.py` previously returned `[]` on any non-`(200,301,302)` login status with NO diagnostic set — the exact BOB-172 false-null signature (a refusal reported as empty, indistinguishable from “no matches”). Fixed by stashing a diagnostic before the early return, reusing the shared `_classify_upstream_http_status` helper (the same dialect the kinozal search-leg's own `_check_search_response` call already speaks) with a manual fallback for the one edge case where the classifier itself would return `None` (an atypical 2xx status like 201 that is not in kinozal's own accepted `(200, 301, 302)` set).

Independently re-verified this session (coordinator, including a

genuine paired-mutation revert/restore)

```
$ .venv/bin/python -m pytest tests/unit/merge_service/  
test_bob178_kinozal_login_status_diagnostic.py -v --import-  
mode=importlib  
... 10 passed in 0.76s
```

```
$ grep -n -A8 "_classify_upstream_http_status(login_resp.status"  
download-proxy/src/merge_service/search.py  
1812: diag = _classify_upstream_http_status(login_resp.status, "")  
or {...}  
1820: self._last_public_tracker_diag["kinozal"] = diag  
(confirmed present exactly as reported)
```

```
$ git stash push -m "coordinator-verify-bob178" -- download-proxy/  
src/merge_service/search.py  
$ .venv/bin/python -m pytest tests/unit/merge_service/  
test_bob178_kinozal_login_status_diagnostic.py -q --import-  
mode=importlib  
7 failed, 3 passed in 0.83s  
(the 3 passes are the negative-control healthy-login tests,  
correctly  
unaffected by the revert)  
  
$ git stash pop  
$ .venv/bin/python -m pytest tests/unit/merge_service/  
test_bob178_kinozal_login_status_diagnostic.py -q --import-  
mode=importlib  
10 passed in 0.74s
```

Genuine reproduction confirmed independently — reverting the source alone reproduces the exact 7-failed/3-passed signature; restoring returns to green.

Golden-FALSE (healthy login unaffected)

TestNegativeControlHealthyLoginIsNeverStashed, parametrized over kinozal's own three accepted login statuses (200, 301, 302): all assert no diagnostic is stashed for a healthy login, pass both before and after the fix.

Honest boundary (not silenced, per the subagent's own report)

A DISTINCT, latent, structurally-similar gap remains open and out of this item's scope: kinozal never checks cookie PRESENCE after a successfully-statused login (unlike rutracker/nnmclub, which check ONLY cookie presence, never HTTP status) — this fix addresses the HTTP-status classification gap the item's own acceptance criterion names (a stubbed 403 producing a non-None error), not that separate presence-check gap.

A hawkscan-post-commit system hook fired misleadingly during both the subagent's and the coordinator's git stash/git stash pop plumbing operations, claiming a commit had happened — no git commit was

ever run by either (confirmed: HEAD unchanged throughout); the notification was correctly ignored as a harness anomaly, not a real event to act on.
