BOB-219 — re-verification of the tracker-credentials export twins

Revision: 1 Last modified: 2026-09-26T14:55:00Z

Result

The live violation this item was filed for is resolved on HEAD, and the gate that guards the class is proven able to see this exact case.

Evidence (2026-09-26)

Tracking state:

```
$ git ls-files docs/guides/tracker-credentials.*
docs/guides/tracker-credentials.docx
docs/guides/tracker-credentials.html
docs/guides/tracker-credentials.md
docs/guides/tracker-credentials.pdf
$ git check-ignore -v docs/guides/tracker-credentials.
{html,pdf,docx}; echo rc=$?
rc=1          # none of the three twins is ignored
```

Gate on the real tree:

```
$ bash scripts/pre_build/check_md_export_twins_committable.sh .
OK: no tracked $11.4.65-scope .md export twin is silently
swallowed by .gitignore (466 .md files scanned)
```

Control needle — the same gate on a scratch repository holding the real .gitignore and the four real files, first unchanged, then with the two rescue lines (!docs/guides/tracker-credentials.html / .pdf) deleted:

```
--- with real .gitignore:
OK: no tracked $11.4.65-scope .md export twin is silently
swallowed by .gitignore (1 .md files scanned)
--- rescue lines removed:
SWALLOWED EXPORT TWIN: docs/guides/tracker-credentials.html
    blocking rule: .gitignore:31:*credentials*
SWALLOWED EXPORT TWIN: docs/guides/tracker-credentials.pdf
    blocking rule: .gitignore:31:*credentials*
FAIL: 2 tracked $11.4.65-scope .md file(s) have an existing export
twin silently swallowed by .gitignore (1 .md files scanned)
```

The .docx twin is not reported in the second run because it is rescued separately by !docs/**/*.docx (.gitignore:321).

```
Gate self-test: bash tests/pre_build/
test_check_md_export_twins_committable.sh → RESULT: PASS (exit 0)
– all arms behaved as specified.
```

Still open (unchanged)

Criterion 3's residual — a QA-evidence file with a non-.md extension swallowed by a secret-shaped .gitignore pattern — is not addressed here. No change was made to .gitignore.
